CONNECTING TO A NETWORK SERVER

ABSTRACT

Connecting to a network server includes determining, at a

first server, to which one of N mirrored servers a request

5   from a client should be routed based at least in part on an

address indicating the client and a route to the client and on

the quality of service between at least some of the N mirrored

servers to the client and determining to route requests from

other clients associated with the address to the one of the N

10   mirrored servers.
